

Fermentap FermWrap Heater

Thank you for purchasing the Fermentap FermWrap Heater. With a little care you should receive many years of brewing pleasure from your FermWrap.

As with any electrical product there are some warnings:

- Do not Cut**
- Do not Submerge**
- Do not insulate both sides**
- Do not use if heater shows signs of Abrasion**

The FermWrap is a 40 watt heater designed to have very low power density. It can be attached with electrical tape to your fermentation vessel, or positioned anywhere you need to apply a little extra heat when fermenting. For maximum life, don't set your carboy directly on top of your heater.

For best results hook up your FermWrap to a temperature controller. The temperature can also be somewhat regulated by attaching only a portion of the heater to your carboy depending on the ambient temperature.

If you are using a refrigerator to control temperature your FermWrap can be used with a two-stage controller to provide both heating and cooling.
